

Connecting with Sorting

Hello Wonderful Zeno Partners!

It is our goal to continue to spark joy and inspire a love of math. Families can engage their children in each math concept before they even receive their games! Let's explore the math concept of Sorting.

Sorting Activities

- Sort family members based on different attributes. Ask them to think of attributes (age, color of t-shirt, sleeve length, etc.) and then use one of those attributes to sort them into groups. Try again using a new attribute.
- While cleaning up, try asking your child to put their toys away based on a new attribute (for example, put blocks away based on their size rather than shape).
- During meals, talk about the different categories of food with your child (fruits, vegetables, grains, etc.). Have them try sorting their food into these categories.
- When doing laundry, work together with your child to sort socks. Have them see if they can find each sock's match. Talk with your child about how they know whether or not the socks match.
- When going on a walk outside, collect different items from nature with your child. Have them see if they can sort the items they collected. They can make one group for leaves, another for sticks, and a third for rocks.

Book Recommendation

- A Pair of Socks by Stuart J. Murphy

Song Recommendation

- One of These Things by Sesame Street
